

Task-Scoped Consent for Personal AI Agents:

documents, webpages, or tool outputs can redirect agents away from the user's intent

by docs/user_study_protocol.md and docs/permission_prompt_examples.md, not an empirical

defenses for tool-using agents with realistic tasks and security cases

Table 1: Main metrics from paper/tables/main_metrics.md.

PAPF is motivated by user-facing permission boundaries, but comprehension is not validated

approximations of agent-specific authorization and information-flow-control systems.
